

Team profile 04

Agroecological production systems and environmental toxicology

Agroecology / Environmental toxicology / Ecosystems

This area connects agroecological production systems with environmental toxicology. It places interactions between production, environment and contaminants within a shared field connected to food security and ecosystem functioning.

Illustrative research questions

- How do production systems interact with their environments?
- How can contaminant-related risks be understood within an ecosystem?

Possible scientific connections

Its themes intersect with environmental microbiology, ecosystem services and the health of living organisms. Modelling can help organise the relationships under investigation.
